PoE Cameras with PoE Router Cabling Guide

1

Network Cable

Use ethernet cable to connect the cameras to your router if it supports POE.

2

Power

If the Router supports PoE (power over ethernet) you can plug the cameras directly into your router, if the Router does not support PoE you would then need to purchase a PoE Switch and plug the camera into the switch and then plug a link between the PoE Switch and Router together using CAT5 ethernet cable.

The Router/Switch will send power over the ethernet cable to the camera.
